

Schema Refinement and Normal Forms

Chapter 19

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

The Evils of Redundancy

- Redundancy is at the root of several problems associated with relational schemas:
 - redundant storage, insert/delete/update anomalies
- Integrity constraints, in particular functional dependencies, can be used to identify schemas with such problems and to suggest refinements.
- ❖ Main refinement technique: <u>decomposition</u> (replacing ABCD with, say, AB and BCD, or ACD and ABD).
- * Decomposition should be used judiciously:
 - Is there reason to decompose a relation?
 - What problems (if any) does the decomposition cause?

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

Functional Dependencies (FDs)

- ❖ A <u>functional dependency</u> $X \rightarrow Y$ holds over relation R if, for every allowable instance r of R:
 - $t1 \in r$, $t2 \in r$, $\pi_X(t1) = \pi_X(t2)$ implies $\pi_Y(t1) = \pi_Y(t2)$
 - i.e., given two tuples in *r*, if the X values agree, then the Y values must also agree. (X and Y are *sets* of attributes.)
- ❖ An FD is a statement about *all* allowable relations.
 - Must be identified based on semantics of application.
 - Given some allowable instance *r*1 of R, we can check if it violates some FD *f*, but we cannot tell if *f* holds over R!
- ❖ K is a candidate key for R means that $K \rightarrow R$
 - However, $K \rightarrow R$ does not require K to be *minimal*!

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

2

Example: Constraints on Entity Set

- Consider relation obtained from Hourly_Emps:
 - Hourly_Emps (<u>ssn</u>, name, lot, rating, hrly_wages, hrs_worked)
- Notation: We will denote this relation schema by listing the attributes: SNLRWH
 - This is really the *set* of attributes {S,N,L,R,W,H}.
 - Sometimes, we will refer to all attributes of a relation by using the relation name. (e.g., Hourly_Emps for SNLRWH)
- Some FDs on Hourly_Emps:
 - ssn is the key: $S \rightarrow SNLRWH$
 - rating determines $hrly_wages$: $R \rightarrow W$

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

W Wages Example (Contd.) 8 10 5 7 Hourly Emps2 ❖ Problems due to $R \longrightarrow W$: N R Η • *Update anomaly:* Can 123-22-3666 Attishoo 48 8 40 we change W in just the 1st tuple of SNLRWH? Smiley 22 30 231-31-5368 8 *Insertion anomaly*: What if 5 30 131-24-3650 Smethurst 35 we want to insert an 434-26-3751 Guldu 35 5 32 employee and don't know the hourly wage for his 612-67-4134 Madayan 35 8 40 rating? N W L R Η **Deletion anomaly**: If we 8 123-22-3666 Attishoo 48 10 40 delete all employees with rating 5, we lose the 231-31-5368 Smiley 22 8 10 30 information about the 131-24-3650 Smethurst 35 5 7 30 wage for rating 5! 434-26-3751 Guldu 35 5 7 32 Will 2 smaller tables be better? 612-67-4134 Madayan 35 8 10 40 5 Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

Reasoning About FDs

- ❖ Given some FDs, we can usually infer additional FDs:
 - $ssn \rightarrow did$, $did \rightarrow lot$ implies $ssn \rightarrow lot$
- ❖ An FD f is <u>implied by</u> a set of FDs F if f holds whenever all FDs in F hold.
 - $F^+ = closure \ of \ F$ is the set of all FDs that are implied by F.
- ❖ Armstrong's Axioms (X, Y, Z are sets of attributes):
 - *Reflexivity*: If $X \subseteq Y$, then $Y \to X$
 - Augmentation: If $X \rightarrow Y$, then $XZ \rightarrow YZ$ for any Z
 - <u>Transitivity</u>: If $X \rightarrow Y$ and $Y \rightarrow Z$, then $X \rightarrow Z$
- * These are *sound* and *complete* inference rules for FDs!

Reasoning About FDs (Contd.)

- * Couple of additional rules (that follow from AA):
 - *Union*: If $X \to Y$ and $X \to Z$, then $X \to YZ$
 - Decomposition: If $X \to YZ$, then $X \to Y$ and $X \to Z$
- * Example: Contracts(cid,sid,jid,did,pid,qty,value), and:
 - C is the key: $C \rightarrow CSJDPQV$
 - Project purchases each part using single contract: $JP \rightarrow C$
 - Dept purchases at most one part from a supplier: $SD \rightarrow P$
- \star JP \to C, C \to CSJDPQV imply JP \to CSJDPQV
- \star SD \to P implies SDJ \to JP
- \star SDJ \to JP, JP \to CSJDPQV imply SDJ \to CSJDPQV

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

7

Reasoning About FDs (Contd.)

- Computing the closure of a set of FDs can be expensive. (Size of closure is exponential in # attrs!)
- * Typically, we just want to check if a given FD $X \rightarrow Y$ is in the closure of a set of FDs F. An efficient check:
 - Compute *attribute closure* of X (denoted X^+) wrt F:
 - Set of all attributes A such that $X \to A$ is in F^+
 - There is a linear time algorithm to compute this.
 - Check if Y is in X^+
- ❖ Does $F = \{A \rightarrow B, B \rightarrow C, CD \rightarrow E\}$ imply $A \rightarrow E$?
 - i.e, is $A \rightarrow E$ in the closure F^+ ? Equivalently, is E in A^+ ?

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

Normal Forms

- Returning to the issue of schema refinement, the first question to ask is whether any refinement is needed!
- ❖ If a relation is in a certain *normal form* (BCNF, 3NF etc.), it is known that certain kinds of problems are avoided/minimized. This can be used to help us decide whether decomposing the relation will help.
- * Role of FDs in detecting redundancy:
 - Consider a relation R with 3 attributes, ABC.
 - No FDs hold: There is no redundancy here.
 - Given $A \rightarrow B$: Several tuples could have the same A value, and if so, they'll all have the same B value!

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

9

Boyce-Codd Normal Form (BCNF)

- * Reln R with FDs F is in BCNF if, for all $X \rightarrow A$ in F^+
 - $A \in X$ (called a *trivial* FD), or
 - X contains a key for R.
- ❖ In other words, R is in BCNF if the only non-trivial FDs that hold over R are key constraints.
 - No dependency in R that can be predicted using FDs alone.
 - If we are shown two tuples that agree upon the X value, we cannot infer the A value in one tuple from the A value in the other.
 - If example relation is in BCNF, the 2 tuples must be identical (since X is a key).

Ī	X	Y	A
ĺ	X	y1	a
	X	y2	?

Third Normal Form (3NF)

- ❖ Reln R with FDs F is in 3NF if, for all X → A in F^+
 - $A \in X$ (called a *trivial FD*), or
 - X contains a key for R, or
 - A is part of some key for R.
- Minimality of a key is crucial in third condition above!
- ❖ If R is in BCNF, obviously in 3NF.
- ❖ If R is in 3NF, some redundancy is possible. It is a compromise, used when BCNF not achievable (e.g., no "good" decomp, or performance considerations).
- Lossless-join, dependency-preserving decomposition of R into a collection of 3NF relations always possible.

 Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

What Does 3NF Achieve?

- * If 3NF violated by $X \rightarrow A$, one of the following holds:
 - X is a subset of some key K
 - We store (X, A) pairs redundantly.
 - X is not a proper subset of any key.
 - There is a chain of FDs $K \rightarrow X \rightarrow A$, which means that we cannot associate an X value with a K value unless we also associate an A value with an X value.
- * But: even if reln is in 3NF, these problems could arise.
 - e.g., Reserves SBDC, $S \rightarrow C$, $C \rightarrow S$ is in 3NF, but for each reservation of sailor S, same (S, C) pair is stored.
- Thus, 3NF is indeed a compromise relative to BCNF.

- Suppose that relation R contains attributes A1 ... An. A <u>decomposition</u> of R consists of replacing R by two or more relations such that:
 - Each new relation scheme contains a subset of the attributes of R (and no attributes that do not appear in R), and
 - Every attribute of R appears as an attribute of one of the new relations.
- ❖ Intuitively, decomposing R means we will store instances of the relation schemes produced by the decomposition, instead of instances of R.
- ❖ E.g., Can decompose SNLRWH into SNLRH and RW.

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

13

Example Decomposition

- * Decompositions should be used only when needed.
 - SNLRWH has FDs S \rightarrow SNLRWH and R \rightarrow W
 - Second FD causes violation of 3NF; W values repeatedly associated with R values. Easiest way to fix this is to create a relation RW to store these associations, and to remove W from the main schema:
 - i.e., we decompose SNLRWH into SNLRH and RW
- The information to be stored consists of SNLRWH tuples. If we just store the projections of these tuples onto SNLRH and RW, are there any potential problems that we should be aware of?

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

Problems with Decompositions

- There are three potential problems to consider:
 - Some queries become more expensive.
 - e.g., How much did sailor Joe earn? (salary = W*H)
 - Given instances of the decomposed relations, we may not be able to reconstruct the corresponding instance of the original relation!
 - Fortunately, not in the SNLRWH example.
 - Checking some dependencies may require joining the instances of the decomposed relations.
 - Fortunately, not in the SNLRWH example.
- * <u>Tradeoff</u>: Must consider these issues vs. redundancy.

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

15

Lossless Join Decompositions

- ❖ Decomposition of R into X and Y is <u>lossless-join</u> w.r.t. a set of FDs F if, for every instance r that satisfies F:
 - $\bullet \quad \pi_{X}(r) \bowtie \pi_{Y}(r) = r$
- * It is always true that $r \subseteq \pi_X(r) \bowtie \pi_Y(r)$
 - In general, the other direction does not hold! If it does, the decomposition is lossless-join.
- * Definition extended to decomposition into 3 or more relations in a straightforward way.
- ❖ It is essential that all decompositions used to deal with redundancy be lossless! (Avoids Problem (2).)

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

More on Lossless Join

- The decomposition of R into X and Y is lossless-join wrt F if and only if the closure of F contains:
 - $X \cap Y \rightarrow X$, or
 - $X \cap Y \rightarrow Y$
- * In particular, the decomposition of R into UV and R - V is lossless-join if $U \rightarrow V$ holds over R.

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

Dependency Preserving Decomposition

- * Consider CSJDPQV, C is key, $JP \rightarrow C$ and $SD \rightarrow P$.
 - BCNF decomposition: CSJDQV and SDP
 - Problem: Checking $JP \rightarrow C$ requires a join!
- Dependency preserving decomposition (Intuitive):
 - If R is decomposed into X, Y and Z, and we enforce the FDs that hold on X, on Y and on Z, then all FDs that were given to hold on R must also hold. (Avoids Problem (3).)
- * *Projection of set of FDs F*: If R is decomposed into X, ... projection of F onto X (denoted F_X) is the set of FDs $U \rightarrow V \text{ in } F^+ \text{ (closure of } F \text{)} \text{ such that } U, V \text{ are in } X.$

Dependency Preserving Decompositions (Contd.)

- * Decomposition of R into X and Y is <u>dependency</u> <u>preserving</u> if $(F_X \text{ union } F_Y)^+ = F^+$
 - i.e., if we consider only dependencies in the closure F⁺ that can be checked in X without considering Y, and in Y without considering X, these imply all dependencies in F⁺.
- ❖ Important to consider F⁺, not F, in this definition:
 - ABC, $A \rightarrow B$, $B \rightarrow C$, $C \rightarrow A$, decomposed into AB and BC.
 - Is this dependency preserving? Is $C \rightarrow A$ preserved?????
- * Dependency preserving does not imply lossless join:
 - ABC, $A \rightarrow B$, decomposed into AB and BC.
- And vice-versa! (Example?)

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

19

Decomposition into BCNF

- ❖ Consider relation R with FDs F. If $X \rightarrow Y$ violates BCNF, decompose R into R Y and XY.
 - Repeated application of this idea will give us a collection of relations that are in BCNF; lossless join decomposition, and guaranteed to terminate.
 - e.g., CSJDPQV, key C, JP \rightarrow C, SD \rightarrow P, J \rightarrow S
 - To deal with SD \rightarrow P, decompose into SDP, CSJDQV.
 - To deal with $J \rightarrow S$, decompose CSJDQV into JS and CJDQV
- In general, several dependencies may cause violation of BCNF. The order in which we ``deal with'' them could lead to very different sets of relations!

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

BCNF and Dependency Preservation

- In general, there may not be a dependency preserving decomposition into BCNF.
 - e.g., CSZ, CS \rightarrow Z, Z \rightarrow C
 - Can't decompose while preserving 1st FD; not in BCNF.
- ❖ Similarly, decomposition of CSJDQV into SDP, JS and CJDQV is not dependency preserving (w.r.t. the FDs JP \rightarrow C, SD \rightarrow P and J \rightarrow S).
 - However, it is a lossless join decomposition.
 - In this case, adding JPC to the collection of relations gives us a dependency preserving decomposition.
 - JPC tuples stored only for checking FD! (Redundancy!)

Database Management Systems, 3ed, R. Ramakrishnan and J. Gehrke

21

Decomposition into 3NF

- Obviously, the algorithm for lossless join decomp into BCNF can be used to obtain a lossless join decomp into 3NF (typically, can stop earlier).
- * To ensure dependency preservation, one idea:
 - If $X \rightarrow Y$ is not preserved, add relation XY.
 - Problem is that XY may violate 3NF! e.g., consider the addition of CJP to `preserve' JP → C. What if we also have J → C?
- ❖ Refinement: Instead of the given set of FDs F, use a minimal cover for F.

Minimal Cover for a Set of FDs

- * Minimal cover G for a set of FDs F:
 - Closure of F = closure of G.
 - Right hand side of each FD in G is a single attribute.
 - If we modify G by deleting an FD or by deleting attributes from an FD in G, the closure changes.
- ❖ Intuitively, every FD in G is needed, and ``as small as possible'' in order to get the same closure as F.
- **♦** e.g., A → B, ABCD → E, EF → GH, ACDF → EG has the following minimal cover:
 - A \rightarrow B, ACD \rightarrow E, EF \rightarrow G and EF \rightarrow H
