

SQL

Chapter 5

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

1

Example Instances

 sid
 bid
 day

 22
 101
 10/10/96

 58
 103
 11/12/96

- We will use these instances of the Sailors and Reserves relations in our examples.
- If the key for the Reserves relation contained only the attributes sid and bid, how would the semantics differ?

<i>S</i> 1	<u>sid</u>	sname	rating	age
	22	dustin	7	45.0
	31	lubber	8	55.5
	58	rusty	10	35.0

sid	sname	rating	age
28	yuppy	9	35.0
31	lubber	8	55.5
44	guppy	5	35.0
58	rusty	10	35.0

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

*S*2

Basic SQL Query

SELECT [DISTINCT] target-list FROM relation-list WHERE qualification

- relation-list A list of relation names (possibly with a range-variable after each name).
- target-list A list of attributes of relations in relation-list
- * *qualification* Comparisons (Attr *op* const or Attr1 *op* Attr2, where *op* is one of <, >, =, \le , \ge , \ne) combined using AND, OR and NOT.
- * DISTINCT is an optional keyword indicating that the answer should not contain duplicates. Default is that duplicates are <u>not</u> eliminated!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

3

Conceptual Evaluation Strategy

- Semantics of an SQL query defined in terms of the following conceptual evaluation strategy:
 - Compute the cross-product of *relation-list*.
 - Discard resulting tuples if they fail *qualifications*.
 - Delete attributes that are not in *target-list*.
 - If **DISTINCT** is specified, eliminate duplicate rows.
- This strategy is probably the least efficient way to compute a query! An optimizer will find more efficient strategies to compute the same answers.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Example of Conceptual Evaluation

SELECT S.sname FROM Sailors S, Reserves R WHERE S.sid=R.sid AND R.bid=103

(sid)	sname	rating	age	(sid)	bid	day
22	dustin	7	45.0	22	101	10/10/96
22	dustin	7	45.0	58	103	11/12/96
31	lubber	8	55.5	22	101	10/10/96
31	lubber	8	55.5	58	103	11/12/96
58	rusty	10	35.0	22	101	10/10/96
58	rusty	10	35.0	58	103	11/12/96

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

A Note on Range Variables

Really needed only if the same relation appears twice in the FROM clause. The previous query can also be written as:

SELECT S.sname

FROM Sailors S, Reserves R

WHERE S.sid=R.sid AND bid=103

OR SELECT sname

FROM Sailors, Reserves

WHERE Sailors.sid=Reserves.sid

AND bid=103

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

It is good style, however, to use range variables always!

SELECT S.sid FROM Sailors S, Reserves R WHERE S.sid=R.sid

- Would adding DISTINCT to this query make a difference?
- ❖ What is the effect of replacing *S.sid* by *S.sname* in the SELECT clause? Would adding DISTINCT to this variant of the query make a difference?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

7

Expressions and Strings

SELECT S.age, age1=S.age-5, 2*S.age AS age2 FROM Sailors S WHERE S.sname LIKE 'B_%B'

- ❖ Illustrates use of arithmetic expressions and string pattern matching: *Find triples* (of ages of sailors and two fields defined by expressions) for sailors whose names begin and end with B and contain at least three characters.
- AS and = are two ways to name fields in result.
- * LIKE is used for string matching. `_' stands for any one character and `%' stands for 0 or more arbitrary characters.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find sid's of sailors who've reserved a red <u>or</u> a green boat

- UNION: Can be used to compute the union of any two *union-compatible* sets of tuples (which are themselves the result of SQL queries).
- If we replace OR by AND in the first version, what do we get?
- Also available: EXCEPT (What do we get if we replace UNION by EXCEPT?)

SELECT S.sid FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND (B.color='red' OR B.color='green')

SELECT S.sid FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='red'

UNION

SELECT S.sid FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='green'

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

٥

Find sid's of sailors who've reserved a red <u>and</u> a green boat

- INTERSECT: Can be used to compute the intersection of any two *union-compatible* sets of tuples.
- Included in the SQL/92 standard, but some systems don't support it.
- Contrast symmetry of the UNION and INTERSECT queries with how much the other versions differ.

SELECT S.sid

FROM Sailors S, Boats B1, Reserves R1,
Boats B2, Reserves R2
WHERE S.sid=R1.sid AND R1.bid=B1.bid
AND S.sid=R2.sid AND R2.bid=B2.bid
AND (B1.color='red' AND B2.color='green')

SELECT S.sid Key field!
FROM Sailors S, Boats B, Reserves R
WHERE S.sid=R.sid AND R.bid=B.bid
AND B.color='red'

INTERSECT

SELECT S.sid

FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='green'

Nested Queries

Find names of sailors who've reserved boat #103:

SELECT S.sname
FROM Sailors S
WHERE S.sid IN (SELECT R.sid
FROM Reserves R
WHERE R.bid=103)

- A very powerful feature of SQL: a WHERE clause can itself contain an SQL query! (Actually, so can FROM and HAVING clauses.)
- ❖ To find sailors who've *not* reserved #103, use NOT IN.
- To understand semantics of nested queries, think of a <u>nested loops</u> evaluation: For each Sailors tuple, check the qualification by computing the subquery.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

11

Nested Queries with Correlation

SELECT S.sname
FROM Sailors S
WHERE EXISTS (SELECT *
FROM Reserves R
WHERE R.bid=103 AND S.sid=R.sid)

- * EXISTS is another set comparison operator, like IN.
- ❖ If UNIQUE is used, and * is replaced by R.bid, finds sailors with at most one reservation for boat #103. (UNIQUE checks for duplicate tuples; * denotes all attributes. Why do we have to replace * by R.bid?)
- Illustrates why, in general, subquery must be recomputed for each Sailors tuple.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

- ❖ We've already seen IN, EXISTS and UNIQUE. Can also use NOT IN, NOT EXISTS and NOT UNIQUE.
- * Also available: *op* ANY, *op* ALL, *op* IN $>, <, =, \ge, \le, \ne$
- ❖ Find sailors whose rating is greater than that of some sailor called Horatio:

SELECT *
FROM Sailors S
WHERE S.rating > ANY (SELECT S2.rating
FROM Sailors S2
WHERE S2.sname='Horatio')

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

13

Rewriting INTERSECT Queries Using IN

Find sid's of sailors who've reserved both a red and a green boat:

SELECT S.sid

FROM Sailors S, Boats B, Reserves R

WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='red'

AND S.sid IN (SELECT S2.sid

FROM Sailors S2, Boats B2, Reserves R2

WHERE S2.sid=R2.sid AND R2.bid=B2.bid

AND B2.color='green')

- Similarly, EXCEPT queries re-written using NOT IN.
- ❖ To find names (not sid's) of Sailors who've reserved both red and green boats, just replace S.sid by S.sname in SELECT clause. (What about INTERSECT query?)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Division in SQL

Find sailors who've reserved all boats.

Let's do it the hard way, without EXCEPT:

(2) SELECT S.sname FROM Sailors S

> WHERE NOT EXISTS (SELECT B.bid FROM Boats B

Sailors S such that ...

WHERE NOT EXISTS (SELECT R.bid

SELECT S.sname FROM Sailors S

WHERE NOT EXISTS

((SELECT B.bid FROM Boats B)

(SELECT R.bid

FROM Reserves R WHERE R.sid=S.sid))

EXCEPT

FROM Reserves R WHERE R.bid=B.bid

there is no boat B without ...

AND R.sid=S.sid))

a Reserves tuple showing S reserved B

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Aggregate Operators

 Significant extension of relational algebra.

COUNT (*) COUNT ([DISTINCT] A) SUM ([DISTINCT] A) AVG ([DISTINCT] A) MAX(A)

single column

SELECT COUNT (*)

FROM Sailors S

SELECT S.sname FROM Sailors S

SELECT AVG (S.age) FROM Sailors S

WHERE S.rating= (SELECT MAX(S2.rating) FROM Sailors S2)

MIN(A)

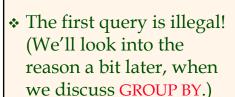

WHERE S.rating=10

SELECT COUNT (DISTINCT S.rating)

SELECT AVG (DISTINCT S.age) FROM Sailors S FROM Sailors S WHERE S.sname='Bob' WHERE S.rating=10

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

The third query is equivalent to the second query, and is allowed in the SQL/92 standard, but is not supported in some systems. SELECT S.sname, MAX (S.age) FROM Sailors S

SELECT S.sname, S.age
FROM Sailors S
WHERE S.age =
(SELECT MAX (S2.age)
FROM Sailors S2)

SELECT S.sname, S.age FROM Sailors S WHERE (SELECT MAX (S2.age) FROM Sailors S2) = S.age

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

17

Motivation for Grouping

- So far, we've applied aggregate operators to all (qualifying) tuples. Sometimes, we want to apply them to each of several *groups* of tuples.
- **❖** Consider: Find the age of the youngest sailor for each rating level.
 - In general, we don't know how many rating levels exist, and what the rating values for these levels are!
 - Suppose we know that rating values go from 1 to 10; we can write 10 queries that look like this (!):

For
$$i = 1, 2, ..., 10$$
:

SELECT MIN (S.age)

FROM Sailors S

WHERE S.rating = i

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Queries With GROUP BY and HAVING

SELECT [DISTINCT] target-list
FROM relation-list
WHERE qualification
GROUP BY grouping-list
HAVING group-qualification

- ❖ The target-list contains (i) attribute names (ii) terms with aggregate operations (e.g., MIN (S.age)).
 - The <u>attribute list (i)</u> must be a subset of *grouping-list*. Intuitively, each answer tuple corresponds to a *group*, and these attributes must have a single value per group. (A *group* is a set of tuples that have the same value for all attributes in *grouping-list*.)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

19

Conceptual Evaluation

- * The cross-product of *relation-list* is computed, tuples that fail *qualification* are discarded, `*unnecessary*' fields are deleted, and the remaining tuples are partitioned into groups by the value of attributes in *grouping-list*.
- ❖ The group-qualification is then applied to eliminate some groups. Expressions in group-qualification must have a <u>single value per group!</u>
 - In effect, an attribute in *group-qualification* that is not an argument of an aggregate op also appears in *grouping-list*. (SQL does not exploit primary key semantics here!)
- * One answer tuple is generated per qualifying group.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find age of the youngest sailor with age ≥ 18 , for each rating with at least 2 such sailors

SELECT S.rating, MIN (S.age) AS minage

FROM Sailors S WHERE S.age >= 18 **GROUP BY S.rating** HAVING COUNT (*) > 1

Answer relation:

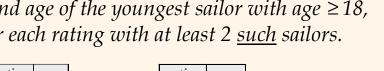

rating	minage
3	25.5
7	35.0
8	25.5

Sailors instance:

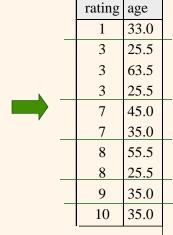

sid	sname	rating	age
22	dustin	7	45.0
29	brutus	1	33.0
31	lubber	8	55.5
32	andy	8	25.5
58	rusty	10	35.0
64	horatio	7	35.0
71	zorba	10	16.0
74	horatio	9	35.0
85	art	3	25.5
95	bob	3	63.5
96	frodo	3	25.5

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find age of the youngest sailor with age ≥ 18 , for each rating with at least 2 such sailors.

rating	age
7	45.0
1	33.0
8	55.5
8	25.5
10	35.0
7	35.0
10	16.0
9	35.0
3	25.5
3	63.5
3	25.5

rating	minage
3	25.5
7	35.0
8	25.5

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find age of the youngest sailor with age \geq 18, for each rating with at least 2 <u>such</u> sailors and with every sailor under 60.

HAVING COUNT (*) > 1 AND EVERY (S.age <=60)

rating	age		rating	age	
7	45.0		1	33.0	
1	33.0	_	3	25.5	
8	55.5		3	63.5	
8	25.5		3	25.5	
10	35.0	_	7	45.0	r
7	35.0		7	35.0	
10	16.0			33.0	H
9	35.0		8	55.5	
3	25.5		8	25.5	L
3	63.5		9	35.0	
3	25.5	_	10	35.0	

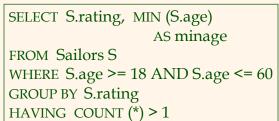

rating minage
7 35.0
8 25.5

What is the result of changing EVERY to ANY?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

23

Find age of the youngest sailor with age ≥ 18 , for each rating with at least 2 sailors between 18 and 60.

Answer relation:

rating	minage
3	25.5
7	35.0
8	25.5

Sailors instance:

<u>sid</u>	sname	rating	age
22	dustin	7	45.0
29	brutus	1	33.0
31	lubber	8	55.5
32	andy	8	25.5
58	rusty	10	35.0
64	horatio	7	35.0
71	zorba	10	16.0
74	horatio	9	35.0
85	art	3	25.5
95	bob	3	63.5
96	frodo	3	25.5

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

For each red boat, find the number of reservations for this boat

SELECT B.bid, COUNT (*) AS scount FROM Sailors S, Boats B, Reserves R WHERE S.sid=R.sid AND R.bid=B.bid AND B.color='red' GROUP BY B.bid

- * Grouping over a join of three relations.
- ❖ What do we get if we remove B.color='red' from the WHERE clause and add a HAVING clause with this condition?
- What if we drop Sailors and the condition involving S.sid?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

25

Find age of the youngest sailor with age > 18, for each rating with at least 2 sailors (of any age)

SELECT S.rating, MIN (S.age)
FROM Sailors S
WHERE S.age > 18
GROUP BY S.rating
HAVING 1 < (SELECT COUNT (*)
FROM Sailors S2
WHERE S.rating=S2.rating)

- ❖ Shows HAVING clause can also contain a subquery.
- Compare this with the query where we considered only ratings with 2 sailors over 18!
- * What if HAVING clause is replaced by:
 - HAVING COUNT(*) >1

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find those ratings for which the average age is the minimum over all ratings

* Aggregate operations cannot be nested! WRONG:

```
SELECT S.rating
FROM Sailors S
WHERE S.age = (SELECT MIN (AVG (S2.age)) FROM Sailors S2)
```

❖ Correct solution (in SQL/92):

```
SELECT Temp.rating, Temp.avgage
FROM (SELECT S.rating, AVG (S.age) AS avgage
FROM Sailors S
GROUP BY S.rating) AS Temp
WHERE Temp.avgage = (SELECT MIN (Temp.avgage)
FROM Temp)
```

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

__

Null Values

- Field values in a tuple are sometimes unknown (e.g., a rating has not been assigned) or inapplicable (e.g., no spouse's name).
 - SQL provides a special value <u>null</u> for such situations.
- ❖ The presence of *null* complicates many issues. E.g.:
 - Special operators needed to check if value is/is not *null*.
 - Is *rating>8* true or false when *rating* is equal to *null*? What about AND, OR and NOT connectives?
 - We need a <u>3-valued logic</u> (true, false and *unknown*).
 - Meaning of constructs must be defined carefully. (e.g., WHERE clause eliminates rows that don't evaluate to true.)
 - New operators (in particular, outer joins) possible/needed.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Integrity Constraints (Review)

- * An IC describes conditions that every *legal instance* of a relation must satisfy.
 - Inserts/deletes/updates that violate IC's are disallowed.
 - Can be used to ensure application semantics (e.g., *sid* is a key), or prevent inconsistencies (e.g., sname has to be a string, age must be < 200)
- * Types of IC's: Domain constraints, primary key constraints, foreign key constraints, general constraints.
 - Domain constraints: Field values must be of right type. Always enforced.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

29

General Constraints

ICs than keys

CREATE TABLE Sailors (sid INTEGER, sname CHAR(10), rating INTEGER,

age REAL,

 Useful when PRIMARY KEY (sid), CHECK (rating ≥ 1 more general

AND rating ≤ 10)

CREATE TABLE Reserves

are involved. (sname CHAR(10), Can use queries bid INTEGER, to express day DATE,

constraint. PRIMARY KEY (bid,day), Constraints can **CONSTRAINT** noInterlakeRes

be named. CHECK (`Interlake' <>

(SELECT B.bname FROM Boats B WHERE B.bid=bid)))

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Constraints Over Multiple Relations

CREATE TABLE Sailors

(sid INTEGER,

sname CHAR(10),

rating INTEGER,

age REAL, PRIMARY KEY (sid),

empty, the CHECK number of Boats

tuples can be anything!

((SELECT COUNT (S.sid) FROM Sailors S)

+ (SELECT COUNT (B.bid) FROM Boats B) < 100

Number of boats

plus number of

sailors is < 100

ASSERTION is the right solution;

Awkward and

wrong!

* If Sailors is

CREATE ASSERTION smallClub

not associated CHECK

with either table. ((SELECT COUNT (S.sid) FROM Sailors S)

+ (SELECT COUNT (B.bid) FROM Boats B) < 100

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

21

Triggers

- Trigger: procedure that starts automatically if specified changes occur to the DBMS
- * Three parts:
 - Event (activates the trigger)
 - Condition (tests whether the triggers should run)
 - Action (what happens if the trigger runs)

Triggers: Example (SQL:1999)

CREATE TRIGGER youngSailorUpdate
AFTER INSERT ON SAILORS
REFERENCING NEW TABLE NewSailors
FOR EACH STATEMENT
INSERT

INTO YoungSailors(sid, name, age, rating)
SELECT sid, name, age, rating
FROM NewSailors N
WHERE N.age <= 18

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

22

Summary

- * SQL was an important factor in the early acceptance of the relational model; more natural than earlier, procedural query languages.
- * Relationally complete; in fact, significantly more expressive power than relational algebra.
- ❖ Even queries that can be expressed in RA can often be expressed more naturally in SQL.
- Many alternative ways to write a query; optimizer should look for most efficient evaluation plan.
 - In practice, users need to be aware of how queries are optimized and evaluated for best results.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Summary (Contd.)

- NULL for unknown field values brings many complications
- SQL allows specification of rich integrity constraints
- Triggers respond to changes in the database

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke
